PUMP FOAM CONCRETE QUICK

THE building of load bearing walls using foam concrete can be quickened using the RBM 1000 Foam Concrete Pumping machine.

The technique uses foam concrete, comprising ingredients mixed in specific compositions and pumped into formwork. Once the concrete foam dries, the formwork is removed and the load-bearing walls are ready, in double quick time!

The RBM-1000 comes in a set comprising mixer, pump and foam generator. An inbuilt automatic weighing scale batches the mix that make up the foam mortar (water, cement, fine sand) in the correct proportion specified for the various load-bearing capacities. A water cooling system is also incorporated.

SETSU'S PRECISION COMPONENTS

SETSU Precision Technology (SPT) produces precision machined components used in environmental monitoring products and systems. These include gas analysers, particulate monitors, complex air monitoring networks and emission monitoring systems.

It is a major precision mechanical component in the ECOTECH EC9800 series, including the EC9810 UV Absorption Ozone Analyser. This combines microprocessor control with ultraviolet (UV) photometry to measure ozone in the range of 0-50 ppb (parts per billion) or 0-20ppm (parts per million) with a detection limit of 0.5 ppb.
